GMO Free Canada says:

Emails from an EPA toxicologist to the EPA official in charge of assessing whether glyphosate, the active ingredient of Monsanto's Roundup herbicide, causes cancer, reveal accusations of 'staff intimidation' and 'political conniving games with the science' to favor pesticide corporations. A particular email, made available through a lawsuit against Monsanto, revealed that career EPA toxicologist Marion Copley states unequivocally to EPA bureaucrat and Monsanto supporter Jess Rowland: "It is essentially certain that glyphosate causes cancer." That is the scientific truth. Yet Monsanto, being the disgusting and thoroughly unethical corporation that it is, keeps fighting this truth in order to dupe farmers and the public into buying their carcinogenic Roundup weedkiller - "as safe as table salt" Monsanto says. And then Monsanto influences the pencil-pusher in the EPA, like Jess Rowland, to do their bidding.

READ: http://www.theecologist.org/./suppressed_epa_toxicologist_i.

READ: https://trofire.com/./former-epa-deputy-director-jess-rowla.

READ the letter: http://gmofreeusa.org/./EPA_MarionCopleyCorrespondenceToJes.

Jess,

Since I left the Agency with cancer, I have studied the tumor process extensively and I have some mechanism comments which may be very valuable to CARC based on my decades of pathology experience. I'll pick one chemical to demonstrate my points.

Glyphosate was originally designed as a chelating agent and I strongly believe that is the identical process involved in its tumor formation, which is highly supported by the literature.

-Chelators inhibit apoptosis, the process by which our bodies kill tumor cells
-Chelators are endocrine disruptors, involved in tumorigenesis
-Glyphosate induces lymphocyte proliferation
-Glyphosate induces free radical formation
-Chelators inhibit free radical scavenging enzymes requiring Zn, Mn or Cu for activity (i.e. SODs)
-Chelators bind zinc, necessary for immune system function
-Glyphosate is genotoxic, a key cancer mechanism
-Chelators inhibit DNA repair enzymes requiring metal cofactors
-Chelators bind Ca, Zn, Mg, etc to make foods deficient for these essential nutrients
-Chelators bind calcium necessary for calcineurin-mediated immune response
-Chelators often damage the kidneys or pancreas, as glyphosate does, a mechanism to tumor formation
-Kidney/pancreas damage can lead to clinical chemistry changes to favor tumor growth
-Glyphosate kills bacteria in the gut and the gastrointestinal system is 80% of the immune system
-Chelators suppress the immune system making the body susceptible to tumors

Previously, CARC concluded that glyphosate was a "possible human carcinogen". The kidney pathology in the animal studies would lead to tumors with other mechanisms listed above. Any one of these mechanisms alone listed can cause tumors, but glyphosate causes all of them simultaneously. It is essentially certain that glyphosate causes cancer. With all of the evidence listed above, the CARC category should be changed to "probable human carcinogen". Blood cells are most exposed to chelators, if any study shows proliferation of lymphocytes, then that is confirmatory that glyphosate is a carcinogen.

Jess, you and I have argued many times on CARC. You often argued about topics outside of your knowledge, which is unethical. Your trivial MS degree from 1971 Nebraska is far outdated, thus CARC science is 10 years behind the literature in mechanisms. For once in your life, listen to me and don't play your political conniving games with the science to favor the registrants. For once do the right thing and don't make decisions based on how it affects your bonus. You and Anna Lowit intimidated staff on CARC and changed HIARC and HASPOC final reports to favor industry. Chelators clearly disrupt calcium signaling, a key signaling pathway in all cells and mediates tumor progression. Greg Ackerman is supposed to be our expert on mechanisms, but he never mentioned any of these concepts at CARC and when I tried to discuss it with him he put me off. Is Greg playing your political games as well, incompetent or does he have some conflict of interest of some kind? Your Nebraska colleague took industry funding, he clearly has a conflict of interest. Just promise me not to ever let Anna on the CARC committee, her decisions don't make rational sense. If anyone in OPP is taking bribes, it is her.

I have cancer and I don't want these serious issues in HED to go unaddressed before I go to my grave. I have done my duty.

Marion Copley

3-4-2017 9and10 news: About three new varieties of GM-potatoes - the Russet Burbank, Ranger Russet and Atlantic.

12-31-2016. Quoted in the New York Times Magazine (October 25, 1998, "Playing God in the Garden"), Philip Angell, Monsanto's director of corporate communications, famously stated:

Archief webpagina Gentechvrij, pagina van The European GMO-free Citizens. Sommige links werken mogelijk niet meer. Voor actuele links kijk op de vernieuwde site www.gentechvrij.nl **Links may be broken see for actual news** www.gentechvrij.nl

"Monsanto shouldn't have to vouchsafe the safety of biotech food. Our interest is in selling as much of it as possible. Assuring its safety is the FDA's job." From the Federal Register, Volume 57, No.104, "Statement of [FDA] Policy: Foods Derived from New Plant Varieties," here is what the FDA had to say on this matter: "Ultimately, it is the food producer who is responsible for assuring safety." Source.

28-12-2016, Ocean Robbins: A special Guest post from Institute for Responsible Technology founder Jeffrey Smith.

Editors note: The vast majority of corn, soybeans, canola, cotton, and sugar beets grown in the U.S. are genetically modified (GMOs). Monsanto and its allies claim that GMO crops reduce pesticide use , increase yields , reduce water consumption, and offer foods that are more tasty and more nutritious . But in the nearly 25 years since GM crops first came on the market, studies have found that they have led to higher pesticide use , and no meaningful improvement in flavor , nutrition , yield or water consumption. Instead, what they've created are plants that are engineered to withstand massive dosing of toxic herbicides, and plants that function as living pesticide factories. Monsanto's Bt. corn, for example, is actually registered with the EPA as a pesticide. Many credible scientists have significant concerns about the safety of these crops for human and animal consumption. And the environmental impacts are documented, and alarming. All from the Foodrevolution site.

Still very important piece: 17th of Agust 2000: Donella Meadows How It Happened That We Don't Regulate Biotech.

Still Very Important Powerpoint Presentation from 2013. "Spraying crops to death". Glyphosate is the most widely used herbicide in the world, found in 750 formulations including Roundup. It is sprayed directly on GMO crops such as corn, soy, canola, sugar and more during the growing season and on non-organic food crops such as wheat, sugar, dried peas, beans, grains and legumes as a drying agent before harvest. It does not wash, dry or cook off and has been shown to destroy gut bacteria and cause series harm at levels far below that which is allowed on our food. Find out more about GMOs and Glyphosate at this important Power Point Presentation. More on glyphosate here.

A GMO (Genetically Modified Organism) is an organism created in a Laboratory by taking genes from one species and forcing them into an entirely unrelated species - in order to achieve a new trait or characteristic that is not possible in nature. From this site.

Doctor's Warning

On May 19th 2009, the American Academy of Environmental Medicine (AAEM) called on "Physicians to educate their patients, the medical community, and the public to avoid GM (genetically modified) foods when possible and provide educational materials concerning GM foods and health risks." From; Spilling The Beans, Jeffrey Smith.

Spanish translation:

El 19 de mayo la American Academy of Environmental Medicine (AAEM) Academia Americana de Mediciana ambiental apeló a „los médicos a educar a sus pacientes; a la comunidad médica y al público a evitar los alimentos GM (genéticamente modificados), si es posible, y a procurar materiales educativos concernientes a los alimentos GM y los riesgos para la salud.

21 mei 2016: 400 Global Cities Vs. Monsanto.

Netherlands: vote to keep glyphosate out of Europe.

16-05-2016: The European Parliament voted last month to stop the EU approve "probably carcinogenic" glyphosate for most uses. Glyphosate weedkillers like Roundup should be completely banned, but the European Commission still seems determined to put Monsanto's interests before public health concerns.

In March, the Netherlands joined France, Sweden, and Italy to oppose a new 15-year licence for glyphosate. Undeterred, the European Commission has tweaked the glyphosate license proposal a little to win over the Netherlands. We need to come together now to make sure the Netherlands government stands up to the agrochemical lobby and the Commission. Go to the petition.

Comment by Jon Rappoport: And if there is any doubt that the authors are talking about the birth defects now being (falsely) attributed to the Zika virus, they follow up with this comment: "There is growing evidence raising concerns about the effects of GBH [glyphosate-based herbicides] on people living in areas where herbicides are intensely used. Women exposed during pregnancy to herbicides delivered offspring with congenital malformations, including microcephaly [small heads], anencephaly [missing major parts of brain and skull in embryos], and cranial malformations."

29-01-2016. The Huffingtonpost published a letter of

Jeffrey Smith.

Here are Jeffrey Smith's warnings to companies and investors considering financial ties to Monsanto:

Monsanto Company's core business is at risk of collapsing based on technical, scientific, and market trends. Their recently announced plan to cut 16% of their global workforce is just the beginning. Monsanto not only faces declining revenues, they have accumulated unprecedented liabilities that may be passed on to investors and business partners. Here are eight reasons to stay clear Monsanto:

- ***Sales of Roundup herbicide and Roundup Ready genetically engineered corn, soy and cotton constitute 90% of Monsanto's revenue. Scientific evidence points to significant health impacts of these products on humans.***

Archief webpagina Gentechvrij, pagina van The European GMO-free Citizens. Sommige links werken mogelijk niet meer. Voor actuele links kijk op de vernieuwde site www.gentechvrij.nl **Links may be broken see for actual news** www.gentechvrij.nl

• For example, the World Health Organization declared Roundup's active ingredient, glyphosate, a probable human carcinogen. Since that announcement in March, 2015, several countries, cities, and retail chains worldwide have banned or severely limited the use of glyphosate products. As of October 2015, at least 700 personal injury non-Hodgkin lymphoma lawsuits were pending against Monsanto.

• Monsanto's liability may persist long into the future. Not only can glyphosate be detected for decades in many types of soil, GMO contamination self-propagates in the gene pool and cannot be fully eradicated.

• Numerous livestock farmers who switch to non-GMO feed report improved livestock health and increased profits. If these claims are validated, Monsanto could lose its biggest GMO market and become liable for extraordinary cumulative losses from an entire industry.

• Monsanto's GMOs-designed to either kill insects or tolerate Roundup herbicide-are failing in the field; as of 2010, superbugs and superweeds are becoming resistant on over 300 million acres worldwide.

• Consumer rejection of GMOs in the United States is prompting food brands to eliminate GMO ingredients and label products "non-GMO." This same trend kicked GMOs out of Europe in 1999 and is now approaching a tipping point in the US, as 58% of consumers are looking for non-GMO products.

• Monsanto's success has been propped up by enormous political clout, especially in the United States. Politics is unstable; it shifts with elections and current events. As the non-GMO movement gains momentum and product safety is questioned, political support may wane, further eroding Monsanto's fortunes.

• Monsanto's negative reputation adds political and economic instability. Referred to as the "World's Most Hated company," their unpopularity was illustrated when hundreds of Moms Across America groups nationwide, and more than 2 million people in 52 countries internationally, took to the streets to "March Against Monsanto."

Combining liabilities for human, animal, and environmental health, Monsanto's legal exposure may far surpass the $206 billion Master Settlement Agreement between the tobacco industry

and 46 US states in 1998. Protect your investments. Steer clear of financial entanglements with Monsanto.

10/01/2016: GMWatch: Renowned Canadian environmentalist Joe Cummins dies from cancer at age 82.

"Environmentalist waged countless high-profile battles, taking aim at everything from GM crops and water fluoridation to chemical contamination of lakes and rivers. We at GMWatch remember Joe Cummins with huge gratitude for his never-failing patience in explaining the technical aspects of the risks of GMOs and their accompanying pesticides. He was always happy to help - and did so with perfect grace, courtesy, and humility. We will miss him."

07-05-2015 [Dr. Mercola: Monsanto Has Known for Nearly 35 Years That GMOs Promote Cancer.]()

Fragment:

The Problem with Genetically Engineered Plants

"According to Dr. Samsel, glyphosate is only one-half of a two-part problem. The other half is the genetically engineered plants. For the past two years, he's been conducting field experiments and laboratory analysis of 33 varieties of genetically engineered corn. This year,

he's branching into soy. Not only are there Roundup-resistant GE crops, there are also Bt crops, which produce their own internal pesticide called Bacillus thuringiensis (Bt). But there are also glyphosate and glufosinate toxins involved, because in many GM crops, the genes are stacked.

"I'm looking at the untreated [genetically engineered corn], and then I'm spraying it with the herbicide [glyphosate]. I'm analyzing the fatty acids and the mineral content. I'm also looking at the isomers of the vitamins. What I'm finding is that there's a difference between those treated with the herbicide and those that are not treated. The herbicide influences the mineral content of even the genetically engineered resistant varieties , making them particularly more deficient in manganese, cobalt, and copper, but particularly manganese. I'm also finding that the fatty acids are being skewed slightly but also the vitamins, particularly the isomers of vitamin E, tocopherol."

He's found that GE varieties of soy, canola, and corn oil contain mostly gamma-tocopherol opposed to alpha-tocopherol (types of vitamin E). Alpha-tocopherol is really beneficial to our biology whereas gamma-tocopherol induces inflammation, particularly in your lungs. Hence Dr. Samsel believes these GE oils may influence rates of asthma and Chronic Obstructive Pulmonary Disease (COPD). On the whole, it seems clear that hundreds of millions of people could improve their health simply by avoiding glyphosate and genetically engineered foods."

ISIS Report 16/03/15 Goats Fed GM Soybean Produce Abnormal Milk, Reduces Weight of Off-Spring

GM-fed goats milk has significantly reduced antibody, fat and protein content and also contained transgenic DNA Dr Eva Sirinathsinghji

Abstract Published Online: January 31, 2015

Jeffrey M. Smith

Jeffrey M. Smith, author of the #1 GMO bestseller Seeds of Deception, talks about his campaign to force mass rejection of genetically modified foods in order to expunge them form the market entirely. Smith explains how the FDA allowed GMO foods to enter the market with no safety testing whatsoever, and that the man primarily responsible for this is now food safety czar in the Obama administration. Smith notes how Obama has broken his pre-election promise that every GMO food should be properly labeled, and also installed pro-GMO

executives in the USDA and FDA who have close ties to Monsanto and the biotechnology industry. Smith documents how consumption of genetically modified foods has been directly

linked with reproductive problems, immune system deficiencies, accelerated ageing, organ damage and gastrointestinal problems. The immune system problem has been seen consistently in mice and rats who are fed GMO food, explains Smith, and now since humans have started consuming genetically modified foods, auto-immune diseases and allergies have increased. Smith explains how research exposing the dangers of genetically modified food has been censored and shut down by the establishment, with scientists involved in such studies finding themselves blacklisted and shunned by their peers before being fired from their jobs in many cases as big agriculture throws its weight around. Smith covers a plethora of vital issues in this one hour interview, and offers workable solutions to phase GMO out of the market, by pushing for proper labeling standards and an intensive education outreach that will help people realize how big a threat genetically modified food poses to their health.

(NaturalNews) Genetically modified apples (Golden Delicious and Granny Smith, named "Arctic") have been approved by the USDA. They don't turn brown.

ISIS Report 07/01/15
CaMV 35S Promoter in GM Feed that Sickened Rats Transferred into Rat Blood, Liver, and Brain Cells. Full length research paper.

These purple carnations are GMOs, just two of them are legal in the EU.

For American and Canadian (who buy USA food) Citizens:

2014: Responsible technology.org:
To the GMO-free Shopping guide and -site.

To the site of Kids right to know (Rachel Parent, Canada.)

10-10-2014: Food Babe, a Must-Read. CONFIRMED! Lab tests show over 30+ popular food products contain GMOs. Are you eating them?

15-11-22014: GOODBYE STARBUCKS!!! by Neil Young.

I used to line up and get my latte everyday, but yesterday was my last one.
Starbucks has teamed up with Monsanto to sue Vermont, and stop accurate food labeling.
Tell Starbucks to withdraw support for the lawsuit -- we have a right to know what we put in our mouths.
Starbucks doesn't think you have the right to know what's in your coffee . So it's teamed up with Monsanto to sue the small U.S. state of Vermont to stop you from finding out.
Hiding behind the shadowy "Grocery Manufacturers Association," Starbucks is supporting a lawsuit that's aiming to block a landmark law that requires genetically-modified ingredients be labeled. Amazingly, it claims that the law is an assault on corporations' right to free speech. MORE.

11-13-2014. Natural Society:A new correlation study published in the Journal of Organic Systems has linked glyphosate, the primary ingredient in Monsanto's best-selling herbicide, Roundup, to an enormous increase in chronic diseases across the United States. - full paper.

In 2013, 93% of soybeans were GE, most of them glyphosate tolerant (6) In 2013, 90% of cotton was GE, with 82% containing HT trait (7). And 90% of corn was GE with 85% containing HT trait (7). Other common GE crops include sugar beets and canola (rapeseed) of which 95% and 93% of which are GE respectively (8), and all are herbicide tolerant (5c). GE varieties of virus resistant squash and papaya are also grown (8). Some drought resistant crops have also been developed (5c). More from Food Safety and Sustainability Center, October 2014, page. 5.

Avoid At-Risk Ingredients (USA).

If it's not labeled organic, or doesn't have a Non-GMO Project Verified Seal , then avoid processed food products ingredients made with these GM crops: Corn, Soybeans, Canola, Cottonseed and Beet sugar.

Corn

Corn flour, meal, oil, starch, gluten, and syrups

- ***Sweeteners such as fructose, dextrose, and glucose***

- ***Modified food starch****

Soy

- ***Soy flour, lecithin, protein, isolate, and isoflavone***
- ***Vegetable oil* and vegetable protein****

Canola Canola oil (also called rapeseed oil)

Cotton Cottonseed oil

Sugar Avoid anything not listed as 100% cane sugar since GM beet sugar recently entered the food supply. To avoid it, look for organic and non-GMO sweeteners, candy and chocolate made with 100% cane sugar, evaporated cane juice or organic sugar.

Aspartame The artificial sweetener also known as NutraSweet and Equal, which is derived from GM microorganisms.

Become familiar with our list of invisible GM ingredients .

Also, more than 50% of Hawaiian papaya is GM, and a small amount of zucchini and yellow squash.

From here.

More on Roundup: ISIS Report 30/03/15 Elsevier Climb Down over Séralini Retraction but IARC Retraction Next for Monsanto

Elsevier has quietly distanced itself from its misdeed, but Monsanto is outrageously calling for another retraction Prof Peter Saunders.

12-11-14 Daily Mail: Hollywood stars sign letter warning British people against GM foods.

GM products are creeping into our Dutch and British shops. You can buy them on internet too without proper labeling see http://www.usfoodz.nl

In the UK and the whole of the EU, foods made with GM ingredients need to say so on the label. This is a legal requirement and is one of the main reasons why there is very little GM on our shelves. However some GM foods, mostly highly processed and often from North America, have been gradually creeping onto the shelves of EU supermarkets and discount retailers. More

Cracker Jacks hell

Posted on December 12, 2012 by Craig Stellpflug NDC

10-06-2014 : Hearing in The Hague.

Archief webpagina Gentechvrij, pagina van The European GMO-free Citizens. Sommige links werken mogelijk niet meer. Voor actuele links kijk op de vernieuwde site www.gentechvrij.nl **Links may be broken see for actual news** www.gentechvrij.nl

Last week, on the 30th of September 2014, Miep Bos, spokeswoman of the European GMO-free Citizens, has attended a hearing organised by the Dutch Ministry of Environment in The Hague because of a notice of appeal we wrote against a test of Intervet.

The subject was a change in testing of little foals from 2 days old and older in the city of Sint Anthonis (Noord Brabant, NL). Intervet asks for permission to change the route of giving the GM vaccine, the changed Rhodococcus equi bacteria by injections among other things with a higher dose.

The manure and hay will be spread in the pasture afterwards. The foals will eventually be killed or sold after the trail.

There will be no investigation re the soil and the bacterium. Intervet says it is not necessary.

The people of Sint Anthonis are not informed. We told some people what is happening and 41 people in that region have undersigned a notice of appeal which we have written. But they are not heard by the Ministry and cannot go to The Council of State (highest Dutch Court , Raad van State) because "They aren't an interested party, because they live too far away" (about one km.)!!!!!

We are waiting for the decision on our appeal, whether the European GMO-free Citizens and the non-profit foundations Vomigen and Ekopark, (Miep Bos wrote an appeal on their behalf) that she represents, are indeed an interested party.

So now people know that the tests are not over yet. In Ireland they did the test too in 2014, but did stop because of the bad results in Germany. In 2013 Intervet did not perform tests in Sint Anthonis. Our question is, are there already results of the test re the soil in Germany ?

Also see the SNIFs:

Nederland, Germany Ireland.

All about the trail in Ireland.

Our plea (Dutch).

"The Whole Paradigm of Genetic Engineering Technology is Based on a Misunderstanding" This misunderstanding is the "one gene, one protein" hypothesis from 70 years ago, which stated that each gene codes for a single protein. However, the Human Genome project completed in 2002 failed dramatically to identify one gene for every one protein in the human body, forcing researchers to look to epigenetic factors -- namely, "factors beyond the control of the gene" - to explain how organisms are formed, and how they work.
According to Vrain: ***"Genetic engineering is 40 years old. It is based on the naive understanding of the genome based on the One Gene - one protein hypothesis of 70 years ago, that each gene codes for a single protein. The Human Genome project completed in 2002 showed that this hypothesis is wrong. The whole paradigm of the genetic engineering technology is based on a misunderstanding. Every scientist now learns that any gene can give more than one protein and that inserting a gene anywhere in a plant eventually creates rogue proteins. Some of these proteins are obviously allergenic or toxic."*** **In other words, genetic engineering is based on an extremely oversimplified model that suggests that by taking out or adding one or several genes, you can create a particular effect or result. But this premise, which GMO expert Dr. Philip Bereano calls "the Lego model," is not correct. You cannot simply take out a yellow piece and put in a green piece and call the structure identical because there are complex interactions that are still going to take place and be altered, even if the initial structure still stands.**

16Th of January 2014 STOP THE CROP: We need your help, right now, to stop a new GMO being grown on the fields. During these weeks in January, the EU member states will decide whether Pioneer's GM maize (technical name 1507) will be allowed to be grown in their country. This would be the first GM maize to be allowed for growing on the field in Europe since 1998. Write to your minister today!

Parlamentarische Anfragen

24. November 2011 E-010966/2011

**Anfrage zur schriftlichen Beantwortung
an die Kommission
Artikel 117 der Geschäftsordnung
Franz Obermayr (NI)**

Betrifft: Unseriöse Gentechnik-Kampagne

Aktuellen Medienberichten ist zu entnehmen, dass Europas Konsumenten jetzt mit einer neuen "Werbekampagne" von den angeblichen Vorzügen der Gentechnik überzeugt werden

sollen. Die Biotech-Industrie möchte der Agro-Gentechnik in Europa schon lange ein positives und verkaufsförderliches Image verschaffen. Ein kürzlich an die Medien gelangtes internes Papier der Biotech-Lobby-Organisation EuropaBio zeigt auf, wie die Strategie eventuell aussehen soll: Der Sänger Bob Geldof und andere Prominente sollen als "Testimonials" und Befürworter der Gentechnik gewonnen werden, um die Bevölkerung auf die angeblichen Vorteile der Gentechnik aufmerksam zu machen, um somit für die Genindustrie wertvolle Überzeugungsarbeit zu leisten.

Trotz der weltweiten Aufrufe, der Hungerkrise ein Ende zu setzen, indem man die Nahrungsmittel gerecht verteilt, setzt die Industrie anscheinend nach wie vor auf das Argument, dass gentechnisch veränderte Pflanzen das Hungerproblem lösen könnten. Die für die Kampagne gewonnenen in der Öffentlichkeit bekannten Personen sollen laut den Kampagnenplänen nicht den Anschein geben, als Gentechnik-Botschafter von der Industrie vorgeschickt zu werden.

EuropaBio will zusätzlich auch noch bekannte Umweltaktivisten für sich arbeiten lassen, die sich in der Öffentlichkeit für Gentechnik aussprechen. Bei der Roundup-Ready-Sojabohne von Monsanto kommt auch noch der aufgelegte ökonomische Schaden hinzu, den man offenbar sehenden Auges in Kauf nimmt. Eine mehrjährige Studie der Universität von Kansas weist nach, dass die besagte Gentech-Soja gegenüber konventionellem Saatgut um zehn Prozent weniger Ertrag liefert. Zur angeblichen Hungerproblemlösung gibt es auch skeptische Studien der Welternährungsorganisation FAO. Daraus resultieren folgende Fragen:

1. Sind der Kommission die diesbezüglichen Pläne von EuropaBio bekannt?
2. Wenn ja, wie steht die Kommission zu diesen Plänen?
3. Die Studien aus den USA (Universität von Kansas) zeigen auf, dass die Ernteerträge aus gentechnischer Landwirtschaft nachweislich geringer ausfallen als im konventionellen Vergleichsmodell. Wie gedenkt die Kommission zu verhindern, dass mit unseriösen Argumenten die Lösung des Hungerproblems "kampagnisiert" wird?

Parliamentary questions

24 November 2011

E-010966/2011

Question to the Commission for written answer

Rule 117

Franz Obermayr (NI)

Subject: Questionable genetic engineering campaign

There are currently reports in the media that a new advertising campaign is now to be waged to persuade European consumers of the alleged benefits of genetic engineering. The biotechnology industry has, for some time now, been keen to promote a positive image of

agro-genetic engineering in Europe in order to boost sales. The media recently got hold of an internal document from the biotech industry lobby group, EuropaBio, which reveals what form this strategy may take: the singer, Bob Geldof, and other celebrities are to be won over to provide 'testimonials' and endorsements of genetic engineering in order to draw the public's attention to the alleged benefits of genetic engineering, thus carrying out valuable advocacy work for the genetic engineering industry. More....
